Output Voltage Programming

The output voltage of the PNJ6 can be programmed to any voltage between 0.75Vdc and 5Vdc by connecting one resistor (shown as Rtrim in Figure 1) between the TRIM and GND pins of the module. Without this external resistor, the output voltage of the module is 0.7525 Vdc. To calculate the value of the resistor Rtrim for a particular output voltage Vo, please use the following equation:

$$Rtrim = \left[\frac{10500}{Vo - 0.7525} - 1000\right]\Omega$$

For example, to program the output voltage of the PNJ6 module to 3.3Vdc, Rtrim is calculated as follows:

$$Rtrim = \left[\frac{10500}{3.3 - 0.7525} - 1000\right]\Omega$$

PNJ6 can also be programmed by apply a voltage between the TRIM and GND pins (Figure 2). The following equation can be used to determine the value of Vtrim needed for a desired output voltage Vo:

$$Vtrim := 0.7 - \left[(Vo - 0.7525)\cdot 0.0667\right]$$

For example, to program the output voltage of a PNJ6 module to 3.3 Vdc, Vtrim is calculated as follows

$$Vtrim := 0.7 - (2.5475\cdot 0.0667) = 0.53V$$

Table 1 provides Rtrim values required for some common output voltages, while Table 2 provides value of external voltage source, Vtrim, for the same common output voltages. By using a 1% tolerance trim resistor, set point tolerance of ±2% can be achieved as specified in the electrical specification.
