- Note. 1. For voltage logic levels, the more positive (less negative) limit is designated as maximum, (e.g. if -10V is a maximum, the typical value is a more negative voltage).
 2: Output short circuit conditions must maintain the total power dissipation below absolute maximum ratings and the sign is used to indicate direction.
 3: Test conditions are those specified by TIA/EIA232-F and as listed above.

■ APPLICATION INFORMATION

Power-Supply protection to meet Power-Off fault conditions of TIA/EIA-232-F

Diodes placed in series with the V_{DD} and V_{SS} leads protect the device in the fault condition in which the device outputs are shorted to $\pm 15V$ and the power supplies are at low and provide low-impedance paths to ground.

Typical Connection

**: Refer Figure 10 to select the correct values for the loading capacitors (C_1 , C_2 , and C_3), which are required to meet the RS-232 maximum slew-rate requirement of $30V/\mu s$. The value of the loading capacitors required depends upon the line length and desired slew rate, but typically is 330 pF .
